DETAILED ACTION

Claim Objections

The claims are objected to because they include reference characters which are not enclosed within parentheses.

Reference characters corresponding to elements recited in the detailed description of the drawings and used in conjunction with the recitation of the same element or group of elements in the claims should be enclosed within parentheses so as to avoid confusion with other numbers or characters which may appear in the claims. See MPEP § 608.01(m).

Claim 1 is objected to because of the following informalities: line 3, "the upper" should be --the upper surface--. Appropriate correction is required.

Claim 3 is objected to because of the following informalities: line 2, "is" should be --are-- for proper grammar. Appropriate correction is required.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-4 are rejected under 35 U.S.C. 102(b) as being anticipated by Chang (US 6,232,551).

Chang discloses an integrated circuit package (Figs. 4, 6-7) having central leads comprising: a substrate (34) having an upper surface, a lower surface, and a long slot

Art Unit: 2811

(54) penetrating from the upper surface to the lower surface, the lower surface forming with wiring regions arranged at the two sides of the long slot (54), and the wiring regions forming with a plurality of connected points (44a), the length of the wiring regions are smaller than long slot (54) of the substrate (34); a resistant layer (see Figs. 5E, 7) coated on the lower surface of the substrate (34), and located between the long slot (54) and wiring region; a glue layer 58 being coated on the upper surface of the substrate and being located at the periphery of the long slot (54); an integrated circuit (56) having a first surface (64) forming with a plurality of bonding pads (60) and a second surface, the first surface (64) being adhered to the glue layer (58), then the bonding pads (60) being exposed from the long slot (54) of the substrate (34); a plurality of wires (62), each of which is arranged within the long slot (54) of the substrate and is electrically connected the bonding pad (60) of the integrated circuit (56) to the connected point (44a) of the substrate; and a first compound layer (68) being filled within the long slot (54) of the substrate for protecting the each wire.

Regarding claim 2, the length of the wiring regions (44a, 44, 44b) are shorter than the long slot (38, 54) of the substrate.

Regarding claim 3, the connected points (44a) of the lower surface of the substrate (34) are formed with ball grid array (BGA 66).

Regarding claim 4, Chang further teaches a second compound layer (68) on the upper surface of the substrate.
